Professional Profile

Detail-oriented data and business analyst with close to a year of professional experience in research, reporting, documentation, process workflows, and cross-functional coordination. My work has involved maintaining structured information, reviewing requirements, identifying process deviations, preparing clear reports, and communicating findings to stakeholders.

Portfolio scope: The QA test cases and bug report in this document are sample demonstrations created for portfolio purposes. They are not presented as client work or as testing performed on an employer's website.

Relevant Experience & Evidence

Area	Evidence from professional background
Accuracy & documentation	Maintained structured regulatory, quality, and technical requirements across an equipment order lifecycle; sustained zero audit findings.
Process validation	Built and maintained a 150+ clause contract-review workflow in Excel VBA and followed structured ITIL-based procedures to resolve process deviations within 24-hour SLAs.
Reporting	Designed Power BI dashboards and streamlined reporting workflows, reducing reporting turnaround by 93%.
Problem investigation	Investigated a 15% conversion-rate discrepancy through structured research and redesigned the lead-qualification process, closing the gap within one month.
Data & analysis	Experience with SQL, Python (NumPy, Pandas, Matplotlib), Advanced Excel (VBA), Power BI, MySQL Workbench, and Jupyter Notebook.
Stakeholder communication	Prepared structured recommendations, presentations, meeting notes, and summaries for cross-functional stakeholders.

Manual QA Testing Approach — Portfolio Demonstration

For a web application, I would use a structured manual-testing cycle: understand requirements → identify test scenarios → write test cases → execute across relevant browsers and devices → record actual results → log reproducible defects → retest fixes → perform regression testing → summarize results and recommendations.

Core Test Areas

Test area	What I would verify
Functional testing	Buttons, links, forms, navigation, authentication, validation messages, and expected workflows.
Usability	Clarity of labels and error messages, navigation consistency, responsive layout, and ease of completing key tasks.
Compatibility	Behavior across supported browsers, screen sizes, and common desktop/mobile environments.
Regression	Previously working functionality after changes or fixes, especially critical user journeys.
Data accuracy	Correct values, calculations, status changes, saved records, and displayed information.
Defect reporting	Clear title, environment, steps to reproduce, expected versus actual result, severity/priority, and evidence.

Sample Manual Test Case

ID	TC-001
Scenario	Valid user login
Precondition	Registered test account exists.
Steps	1. Open login page. 2. Enter valid email. 3. Enter valid password. 4. Select Login.
Expected	User is authenticated and redirected to the expected account/dashboard page.
Result	Pass/Fail to be recorded during execution.
Notes	Demonstration test case only; not executed against the employer's site.

Sample Bug Report

Title: Demo checkout button remains disabled after valid required fields are completed

Environment: Demonstration web application; desktop browser; test data only.

Steps to reproduce: 1) Open demo checkout page. 2) Complete all mandatory fields with valid test data. 3) Review the checkout action.

Expected: Checkout action becomes available when all mandatory inputs are valid.

Actual: Button remains unavailable despite all required fields being completed.

Severity: Medium (sample classification). **Priority:** To be confirmed by product/team.

Evidence: Screenshot/video would be attached during real execution.

Reporting & Quality Tracking

I am comfortable maintaining structured records in Excel and documenting findings clearly. A weekly QA report can include test execution totals, pass/fail counts, open defects, retest status, recurring issues, blockers, and recommendations.

Education & Certifications

B.Tech, Applied Petroleum Engineering — Additional Diploma in Cybersecurity, UPES (2021–2025). Certifications include AI in Data Analytics & AI Professional Certificate (Google via Udemy), Data Fundamentals (IBM SkillsBuild), Introduction to Data for Decision Makers (BCG X via Forage), and Technology Consulting (Accenture via Forage).

Portfolio note: This document intentionally distinguishes professional experience from sample QA demonstrations and does not claim prior client QA work that is not listed in my resume.
